WebTop Implementation Methodology 2

In this implementation methodology, WebTop is installed on a server computer directly inside the target network. Implemented in this way, the Positive Networks POP-based Network Architecture is not needed. The end users directly connect to the target network with their web browsers.
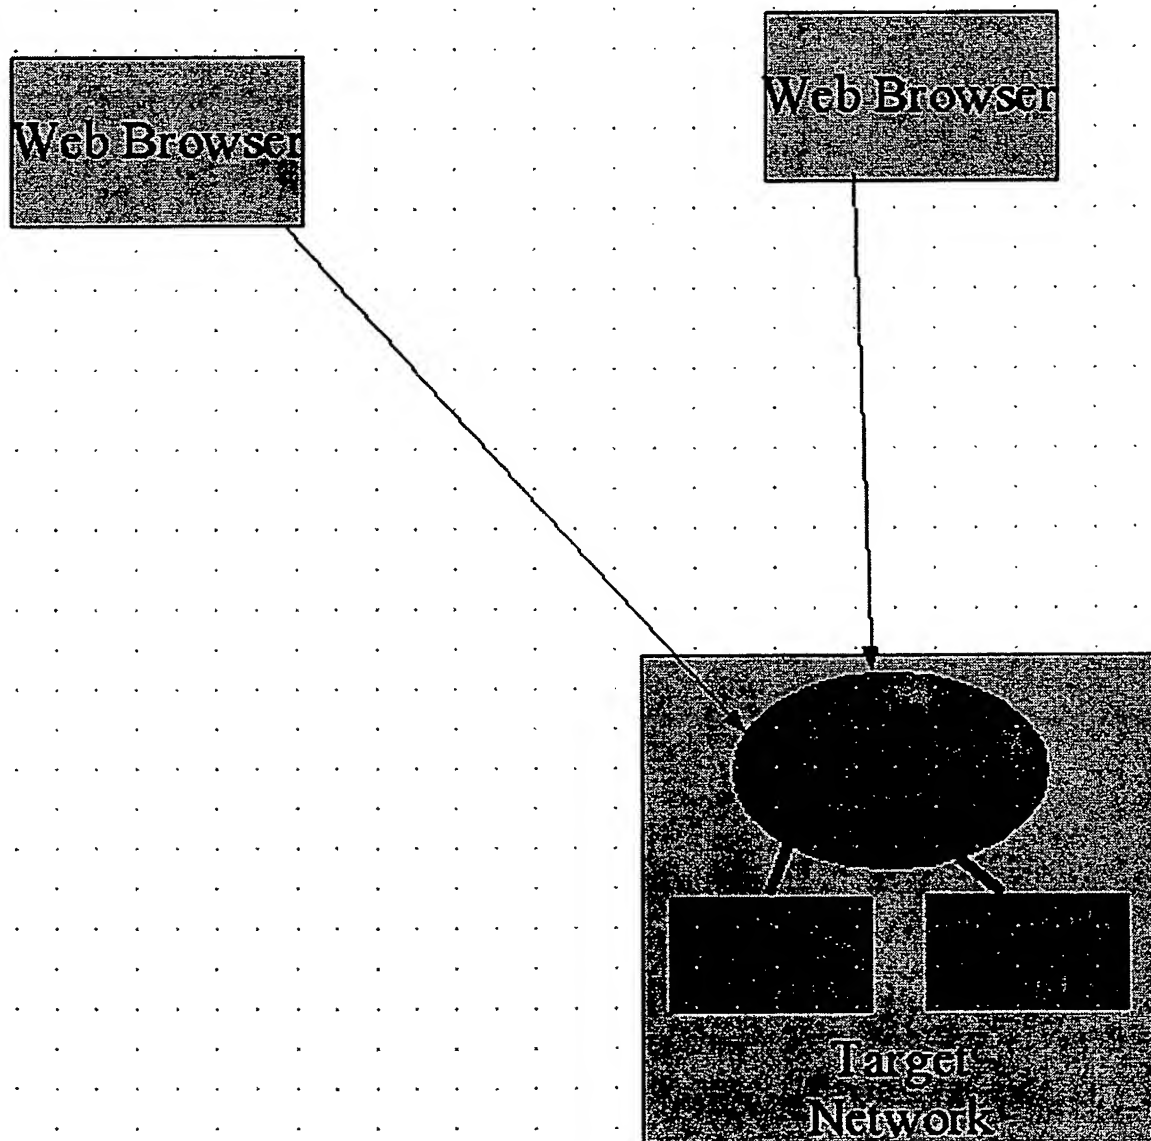

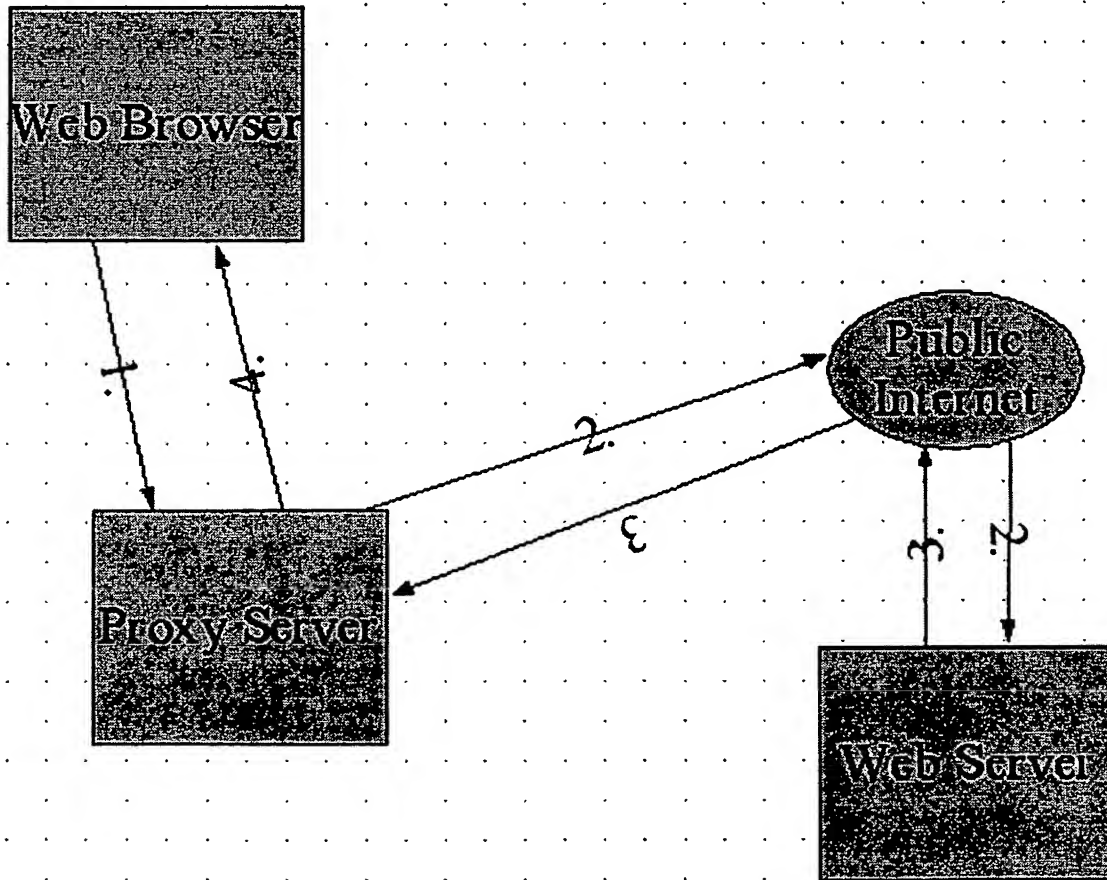

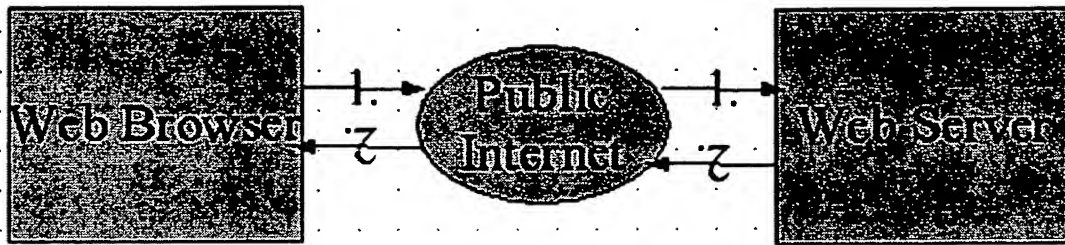

WebTop Implementation Methodology 1

With this implementation methodology, WebTop is located at a POP. It is connected to target networks via standard Customer Connections, as described in the Network Architecture section of this document. Users connect to WebTop at a POP, which provides for all the benefits of the POP-based Architecture.

Positive Networks POP-Based Network Architecture

This implementation of the Positive Networks POP-Based Network Architecture allows for all of the benefits described in the corresponding section elsewhere in this document. WebTop and Network VPN users make direct connections to a POP, which in turn makes appropriate connections to target networks and target network resources

Web Browser

NetVPN User
